# CC31xx SLS Sniffer with Filters Application

## Overview

This sample application demonstrates how NWP filters can be added to CC3100 for managing the Rx filtering process.

The Rx-Filters feature enables the user to simply define, and manage the Rx-filtering process. It reduces the amount of traffic transferred to the host, and achieves an efficient power management.

The host-driver supplies a set of APIs to enable filter creation\editing. The APIs include the following operations:

- Add nodes: The user may request to add new node to the database, the node is created and a node unique ID is returned back to the user. The user should disable all filters before adding a node.
- Remove nodes: The user may request to remove a node from the filters' database, the node is removed. The user should disable all filters before removing a node.
- Enable nodes: The user can request to enable one or more filters, filters which are enabled, take part in the matching process.
- Disable nodes: The user can request to disable one or more filters, filters which are disabled, don take part in the matching process.
- · Get filter node
- Update filter node

The application is responsible for adding filter nodes and defining the filters' tree hierarchy. If the user is interested in storing a filter node in the flash memory, he should set the persistence flag of the node. A filter can be defined as persistent only if its parent is persistent. Persistent filter nodes will be loaded automatically upon system startup.

The application developer can choose one or more filters to disable\enable, filters which are disabled don't take part in the matching process.

Note: This wiki page is only applicable for CC3100-SDK v0.5.2 and upward releases. For documentation on older SDKs' examples, refer corresponding file in <cc3100-sdk-installation-location>\cc3100-sdk\docs\examples\

# **Application details**

This application opens a raw socket in transceiver-mode, creates and applies filters based on the user input and prints the wireless data packets on the console

Filter can be created based on:

- Source MAC address
- Destination MAC address
- BSSID
- Frame subtype: Some possible subtype bytes are
  - Data: 8

Probe Request: 40 Probe Response: 50

Beacon: 80QOS Data: 88

Acknowledgement: d4

- · Source IP address
- Destination IP address
- · Packet length

For information on how to use Visual-Studio or Eclipse to compile and run this application, refer to cc3100\_getting\_started\_guide\_swru375 <sup>[1]</sup> in '<cc3100/>docs' folder.

By default, this application communicates w/ CC3100 over SPI. The SDK has UART-Drivers as well for 'SimpleLink Studio' platform. For using the UART interface to communicate w/ CC3100, macro SL\_IF\_TYPE\_UART has to be defined in the application-project's properties. Also, 'COMM\_PORT\_NUM in main.c needs to be changed to the first com-port that gets enumerated for 'J6' of 'CC31xxEMUBOOST Brd'. In case four ports are getting enumerated, user should use the third com-port.

# **Usage**

- Compile and run the application.
- Enter the channel and no of packets to be received.
- Enter 'f' to configure the filter.
- Configure the filter.
- Enter '9' to enable the filter and start receiving the packets.

# **Limitations/Known Issues**

- Payload rule is currently not supported
- Filter's action of sending EVENT to the host upon a match is currently not supported.
